

WORLD OCEAN DAY 2020

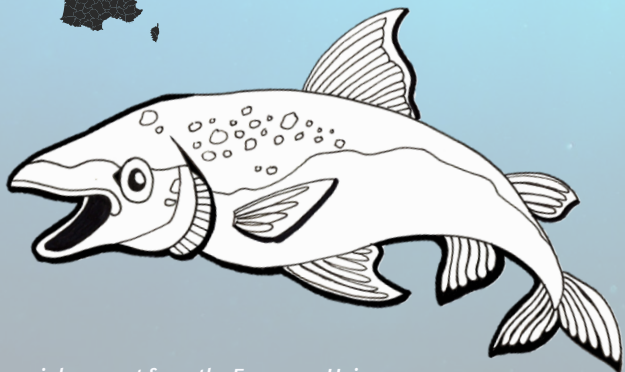

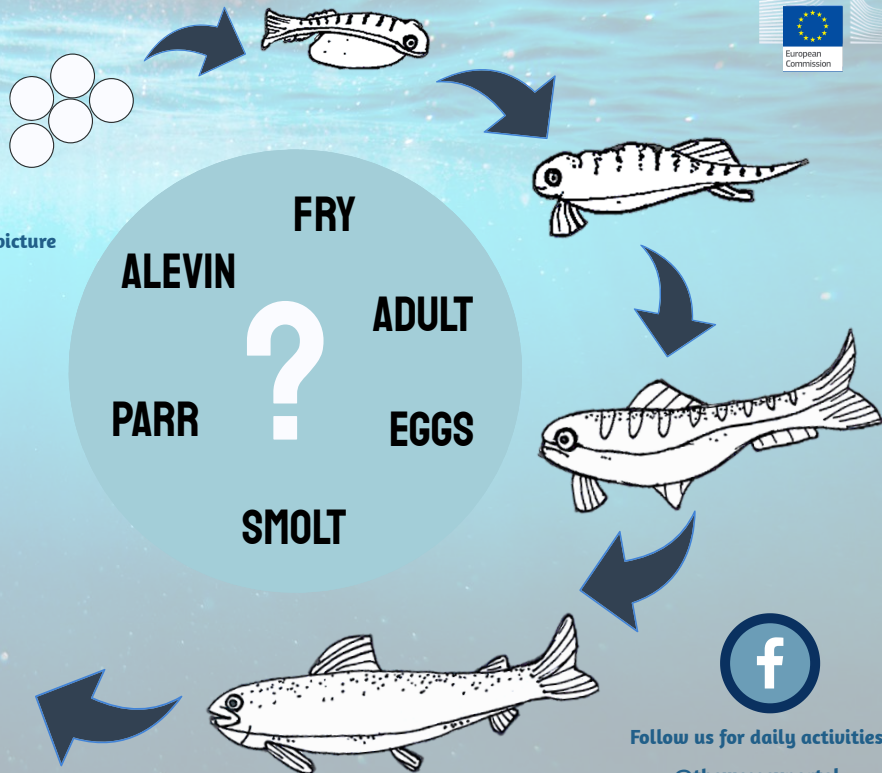

SPECIES FOCUS: ATLANTIC SALMON

Today we are showcasing the fascinating life cycle of a salmon. Salmon are found in freshwater rivers, where they start their life cycle as eggs. Once hatched, they go through a series of development stages as they start a long journey to the sea.

When they are fully grown adults, they live in the sea until they return to the same river they were born in to make a nest and lay eggs.

ACTIVITY: Match the life cycle stage to each picture and colour the salmon in!
